Mathematical Preliminaries VECTOR & MATRIX ALGEBRA

Recap: Data Mining Process

Vectors in Low- and High-dimensional Spaces

Points in 2-dimensional space

Data Points in 2-d

point	X	y
p1	0	2
p2	2	0
p3	3	1
p4	5	1

Do not mix with length(v) in R:

• number of vector components, d

Point ← Vector

$$p3 = (x, y) \leftrightarrow v3 = (x, y)$$

Vector has:

- The origin (0,0)
- The direction
- The length/norm: ||v||

In **d**-dimensional space:

$$p = (p_1, p_2, ..., p_d) \in R^d \iff$$

$$v = (v_1, v_2, ..., v_d) \in R^d$$

Vector length/norm (e.g. L_2 -norm):

scalar
$$\|v\|_2 = \sqrt{\sum_{k=1}^d (v_k)^2} \in R$$

Normalized Vector $(L_2$ -norm=1):

$$u = \frac{v}{\parallel v \parallel}$$

Ex #1: Vector Norm

Consider the vector in a two-dimensional space:

$$v=(1,-2)\in\mathbb{R}^2$$

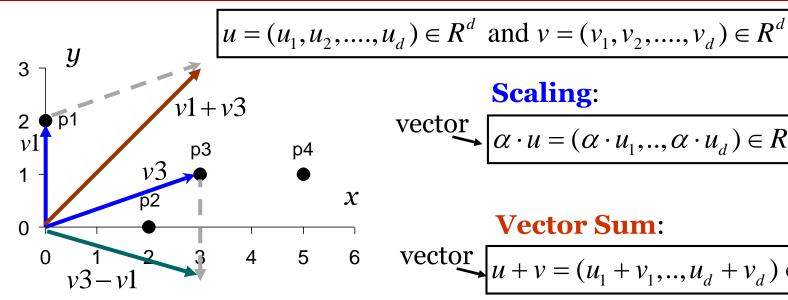

a. What is the length, i.e., the L_2 -norm of this vector? Show calculations by hand. Validate the result by showing the R code that does the same.

$$||v|| =$$

b. Normalize this vector to the unit length? Show calculations by hand. Validate the result by showing the R code that does the same.

$$||v_n|| =$$

Some Vector Operations

Scaling:

vector $\alpha \cdot u = (\alpha \cdot u_1, ..., \alpha \cdot u_d) \in R^d$

Vector Sum:

vector
$$u + v = (u_1 + v_1, ..., u_d + v_d) \in \mathbb{R}^d$$

Data Points in 2-d

point	X	y
p1	0	2
p2	2	0
р3	3	1
p4	5	1

Vector Difference:

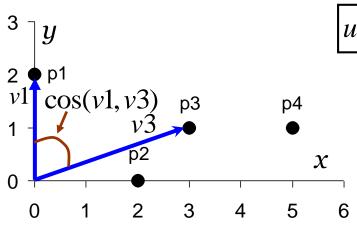

vector
$$u - v = (u_1 - v_1, ..., u_d - v_d) \in R^d$$

scalar
$$(u, v) = u_1 \cdot v_1 + \dots + u_d \cdot v_d \in R$$

Scalar Product of Two Vectors:

- v = c(5,1,3); u = c(2,5,5)

Cosine between Two Vectors

Data Points in 2-d

point	X	y
p1	0	2
p2	2	0
р3	3	1
p4	5	1

$$||v1|| = \sqrt{4} = 2$$

$$||v3|| = \sqrt{10}$$

$$(v1, v3) = 3 \cdot 0 + 1 \cdot 2 = 2$$

$$\cos(v1, v3) = \frac{2}{2 \cdot \sqrt{10}} = \frac{1}{\sqrt{10}}$$

$$u = (u_1, u_2,, u_d) \in R^d$$
 and $v = (v_1, v_2,, v_d) \in R^d$

Scalar Product of Two Vectors:

scalar
$$(u, v) = u_1 \cdot v_1 + \dots + u_d \cdot v_d \in R$$

Vector length/norm (e.g. L_2 -norm):

scalar
$$\|v\|_2 = \sqrt{\sum_{k=1}^d (v_k)^2} \in R$$

Cosine between Two Vectors:

scalar
$$\cos(u,v) = \frac{(u,v)}{\|u\| \cdot \|v\|} \in R$$

Orthogonal Vectors:

$$u \perp v \Rightarrow \cos(u, v) = 0 \Rightarrow (u, v) = 0$$

$$u = (1, 1), v = (1, -1)$$

Ex #2: Scalar/Inner Product & Cosine

Consider two vectors in a two-dimensional space:

$$v = (1, -2), u = (2, 1) \in \mathbb{R}^2$$

a. What is the scalar product (aka inner product) of these two vectors? Show calculations by hand. Validate the result by showing the R code that does the same. Is scalar product symmetric, i.e. (v, u) = (u, v)?

$$(\boldsymbol{v},\boldsymbol{u}) = (\boldsymbol{u},\boldsymbol{v}) =$$

b. What is the value of cos(u, v)? Show calculations by hand. Validate the result by showing the R code that does the same. Are these two vectors perpendicular, i.e., angle is 90° ?

$$cos(u, v) =$$

Ex #3: Scalar/Inner Product & Cosine

Consider two vectors in a four-dimensional space:

$$v = (1, -2, 1, -2), u = (2, 1, 2, 1) \in \mathbb{R}^4$$

a. What is the scalar product (aka inner product) of these two vectors? Show calculations by hand. Validate the result by showing the R code that does the same. Is scalar product symmetric, i.e. (v, u) = (u, v)?

$$(v, u) = (u, v) =$$

b. What is the value of cos(u, v)? Show calculations by hand. Validate the result by showing the R code that does the same. Are these two vectors perpendicular, i.e., angle is 90° ?

$$cos(u, v) =$$

Vector Transpose (v^T)

 \boldsymbol{v}

- v = c (5,1,3);
 vt = t (v);
 help (t)

Lines, Planes, Hyperplanes, Normal Vectors

Line in 2-dimensions:

$$y = ax + b$$
, or equivalently $l: a_1x_1 + a_2x_2 + b = 0$

$$l: x_1 + x_2 - 2 = 0$$

 $w_{\perp} = (1,1)^T \text{ and } b = -2$

Line, $l \leftrightarrow Normal Vector$ (orthogonal to l)

$$l \leftrightarrow w_{\perp} = (a_1, a_2)^T$$

$$x = (x_1, x_2)$$

$$w_{\perp} = (a_1, a_2)^T$$

$$l : x \cdot w_{\perp} + b = 0$$

Plane in 3-dimensions:

$$a_1 x_1 + a_2 x_2 + a_3 x_3 + b = 0$$

Hyper-plane in d-dimensions:

$$a_1 x_1 + a_2 x_2 + \dots + a_d x_d + b = 0$$

$$l \leftrightarrow w_{\perp} = (a_1, a_2, ..., a_d)^T$$

Ex #4: Normal Vector to a Line

Consider the line in a 2-dimensional space:

$$l: x_1 - x_2 + 2 = 0 \in \mathbb{R}^2$$

- a. What is the normal vector \mathbf{w}_{\perp} for the line, i.e. the perpendicular vector to this line? $\mathbf{w}_{\perp}(\mathbf{l}) = ?$
- b. What is the value of the intercept *b* for this line?

$$\boldsymbol{b} = ?$$

c. Choose any point *p* that lies on this line and give its coordinates:

$$p=(x_1=\quad,x_2=\quad)\in l$$

d. Show (by manual calculations) that the following is true:

$$(\boldsymbol{p}, \boldsymbol{w}_{\perp}) + \boldsymbol{b} = \boldsymbol{0}$$

Ex #5: Normal Vector to a Plane

Consider the plane in a 3-dim. space:
$$\alpha$$
: $x_1 + x_2 - x_3 - 1 = 0 \in \mathbb{R}^3$

- a. What is the normal vector \mathbf{w}_{\perp} for the plane, i.e. perpendicular vector to this plane? $\mathbf{w}_{\perp}(\alpha) = ?$
- b. What is the value of the intercept b for this plane?

$$\boldsymbol{b} = ?$$

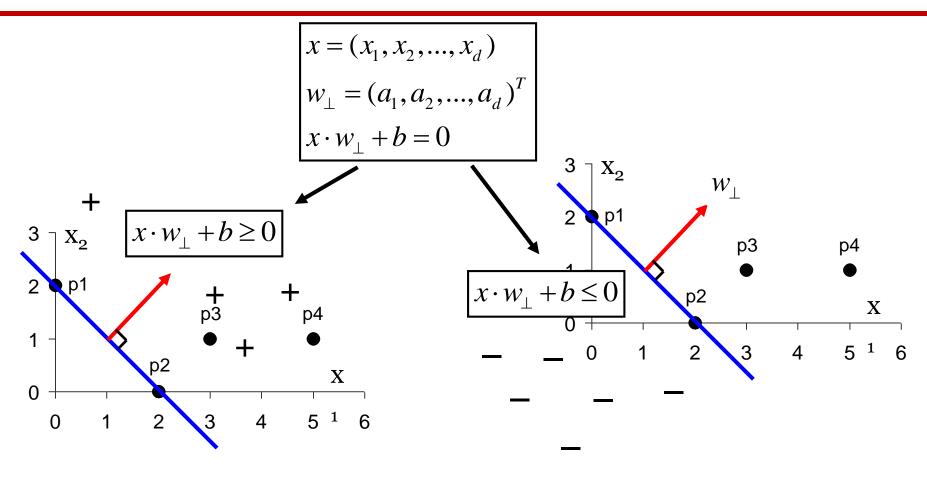

c. Choose any point p that lies on this plane and give its coordinates:

$$p=(x_1=\quad$$
, $x_2=\quad$, $x_3=\quad$) $\in \alpha$

d. Show (by manual calculations) that the following is true:

$$(\boldsymbol{p}, \boldsymbol{w}_{\perp}) + \boldsymbol{b} = \boldsymbol{0}$$

Half-Planes, Half-Spaces, Half-Hyperspaces

$$x = p3 = (3,1)$$

 $w_{\perp} = (1,1)^{T} \text{ and } b = -2$
 $p3 \cdot w_{\perp} + b = 3 \cdot 1 + 1 \cdot 1 - 2 = 2 \ge 0$

Ex #6: Half-Planes

Consider the plane in a 3-dim. space:

$$\alpha: x_1 + x_2 - x_3 - 1 = 0 \in \mathbb{R}^3$$

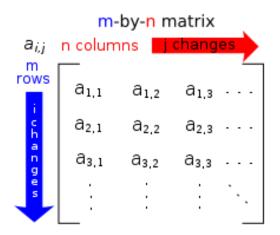

- a. Give coordinates of any point p that lies in the **positive half-plane** of this plane: $p = (?,?,?) \in \alpha$
- b. Show (by manual calculations) that the following is true:

$$(p, w_{\perp}) + b > 0$$

- d. Give coordinates of any point q that lies in the **negative half-plane** of this plane: $q = (?,?,?) \in \alpha$
- e. Show (by manual calculations) that the following is true:

$$(q, w_{\perp}) + b < 0$$

Matrix and its Transpose

$$\left(A^{T}\right)_{i,j} = A_{j,i}$$

$$(A^T)^T = A$$

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & -6 & 0 \end{bmatrix}^T = \begin{bmatrix} 1 & 0 \\ 2 & -6 \\ 3 & 0 \end{bmatrix}$$

- A = matrix(c(1,0,2,-6,3,0), nrow=2, ncol=3);
- *A*;
- B = t(A);
- *B*;
- t (B);
- help (t)

Ex #7: Transpose of the Matrix

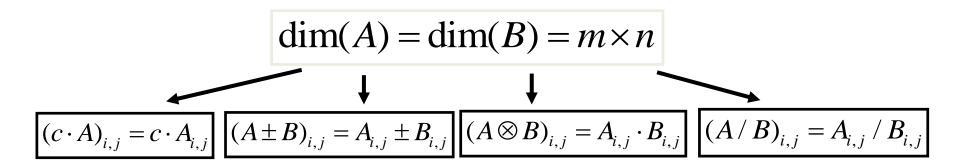

Consider the following 3-by-2 matrix:

$$\mathbf{A} = \begin{bmatrix} 1 & -2 \\ 0 & 3 \\ 2 & -1 \end{bmatrix}$$

- a. What is the value of A[3,2] = 2
- b. Show its transpose matrix and validate with R code: $A^T =$

- c. What is the value of $A^T[1, 2] = ?$
- d. If the matrix had *m* rows and *n* columns, then how many rows the transpose matrix will have?

Some Matrix Operations: Element-by-Element

A=matrix(c(54,49,49,41,26,43,49,50,58,71),nrow=5,ncol=2)) B=matrix(c(1:10), nrow=5, ncol=2))

To perform element-by-element ops:

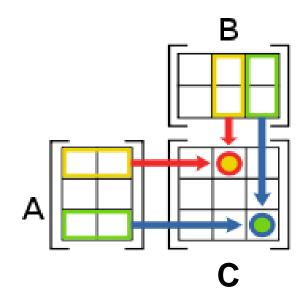

Matrix-Matrix Multiplication

$$\dim(A) = m \times n$$

$$\dim(B) = n \times k$$

$$C = A * B$$

$$\dim(C) = m \times k$$

$$(A * B)_{i,j} = A_{i,1}B_{1,j} + A_{i,2}B_{2,j} + \dots + A_{i,n}B_{n,j}$$
$$= \sum_{r=1}^{n} A_{i,r}B_{r,j}$$

$$\begin{bmatrix}
\frac{1}{-1} & \frac{0}{3} & \frac{2}{1} \\
-1 & 3 & 1
\end{bmatrix} \times \begin{bmatrix} 3 \\ 2 \\ \frac{1}{2} \\ \frac{1}{0} \end{bmatrix} = \begin{bmatrix} 5 & \frac{1}{2} \\ 4 & 2 \end{bmatrix}.$$

$$\underline{2} \times 3 \qquad 3 \times \underline{2} \qquad \underline{2} \times \underline{2}$$

In R:

$$C = A\%*\%B;$$

Ex #8: Matrix-Matrix Multiplication

- 1. Generate in R a 3-by-3 matrix A filled with one's everywhere but the diagonal; and with 3's on the diagonal.
- 2. Generate in R a 3-by-2 matrix B filled with two's.
- a. Multiply in R matrix A by matrix B and print the resulting matrix C:

$$C = AB =$$

- b. What is the size of this new matrix \mathbf{C} , i.e. number of rows and cols?
- c. Can you multiply matrix B by A to get matrix D (why or why not):

$$D = BA =$$

d. Show with manual calculations how you will get the value of:

$$C[2, 2] =$$

Ex #9: Projection Matrix

- 1. Generate in R a 4-by-2 matrix A and plot its 4 rows as points in 2-dim.
- 2. Generate a 2-by-2 matrix with diagonal elements as one's and off-diagonal matrix as zero's (aka *identity* matrix, I).
- a. Multiply in R matrix A by matrix I and print the resulting matrix C:

$$C = AI =$$

- b. Set the I[2,2] element to zero and assign the new matrix to P.
- c. Multiple matrix A by the modified matrix I to get matrix D:

$$\mathbf{D} = A P =$$

- d. Add the rows of matrix D as four points in 2-dim. to your original plot of A. Do you observe that these new points are projections of the original points? What axis are the points of A projected to in D?
- e. How will you modify the identity matrix I to project the points of A on the other axis?

Advanced Topics: Optional

Inverse of a Square Matrix, nrow(A)=ncol(A)

Identity Matrix, I_n

$$I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Determinant, det(A), |A|

scalar:
$$\det \begin{pmatrix} a \\ c \\ d \end{pmatrix} = \underbrace{ad}_{bc} - \underbrace{bc}_{d}$$

Matrix Inverse, A^{-1}

$$A * A^{-1} = A^{-1} * A = I$$

$$A^{-1}$$
 exists \Leftrightarrow det $(A) \neq 0$

2-by-2 Matrix Inverse

$$A^{-1} = \frac{1}{\det(A)} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

n-by-n Matrix Inverse

- LU-factorization
- Gaussian elimination
- Gauss-Jordan elimination

Mathematical Preliminaries MATRIX DECOMPOSITION & TRANSFORMATIONS

Linear Transformation Matrix

Matrix-based Transformation of Vectors

$$V_{old} \xrightarrow{\text{matrix}, A} V_{new}$$

- •Scaling Matrix
- •Reflection Matrix
- Rotation Matrix
- Projection Matrix

Notation

$$u = [u_1, u_2, ..., u_p]$$
 - row vector

$$\mathbf{v} = \begin{bmatrix} v_1 \\ \dots \\ v_m \end{bmatrix}$$
 - column vector

$$\mathbf{A} = \mathbf{A}_{m \times p} = \begin{bmatrix} a_{11} & \dots & a_{1p} \\ \dots & \dots & \dots \\ a_{m1} & \dots & a_{mp} \end{bmatrix} - m \times p \text{ matrix}$$

$$I = I_{m \times m} = \begin{bmatrix} 1 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 \\ \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
 - identity matrix

Scaling Matrix

Row vectors:

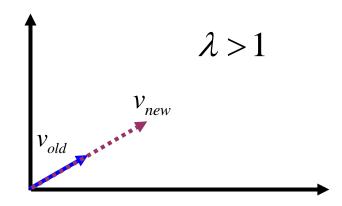

$$v_{old} \in R^p \xrightarrow[\text{matrix}, A \text{scalar}, \lambda \in R^+]{} v_{new} = \lambda \cdot v_{old} \in R^p$$

$$\boldsymbol{A}_{\lambda} = \lambda \cdot \boldsymbol{I}_{p \times p} = \begin{bmatrix} \lambda & 0 & \dots & 0 \\ 0 & \lambda & \dots & 0 \\ \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & \lambda \end{bmatrix} - \text{scaling matrix}$$

$$v_{new} = v_{old} \cdot \boldsymbol{A} = v_{old} \cdot \lambda \cdot \boldsymbol{I}_{p \times p}$$

- Unchanged:
 - Direction of a vector
- •Changed:
 - Vector norm/length

$$||v_{new}|| = \lambda \cdot ||v_{old}||$$

Reflection Matrix

Row vectors:

$$v_{old} \in R^p \xrightarrow[\text{matrix}, A]{} v_{new} = v_{old} \cdot A \in R^p$$

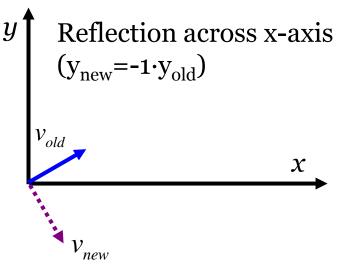

$$A = I'_{p \times p} = \begin{bmatrix} 1 & 0 & \dots & 0 \\ 0 & -1 & \dots & 0 \\ \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
 - reflection matrix; some elements are -1

$$v_{new} = v_{old} \cdot A$$

Equivalent to: multiplying one or more vector components by -1

•Changed:

- Direction of a vector
- Reflects across >=1 axis
- Unchanged:
 - Vector norm/length

Rotation Matrix

Row vectors:

$$v_{old} \in R^p \xrightarrow[\text{matrix}, A]{\text{matrix}, A} v_{new} = v_{old} \cdot A \in R^p$$

$$det(A) = 1$$

$$A^T = A^{-1}$$

•Changed:

- Direction of a vector
- Unchanged:
 - Vector norm/length

$$\boldsymbol{A} = \boldsymbol{A}_{p \times p} = \begin{bmatrix} a_{11} & \dots & a_{1p} \\ \dots & \dots & \dots \\ a_{p1} & \dots & a_{pp} \end{bmatrix} - p \times p \text{ orthogonal matrix}$$

$$A^{T} = A^{-1}$$
 – orthogonal matrix

$$det(A)=1$$

Example:
$$p=2$$

$$A(\theta) = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix} - \text{clockwise rotation by } \theta$$
Rotation by any angle
$$v_{old}$$

$$v_{new}$$

$$v_{new}$$
29

Projection Matrix

Row vectors:

- $v_{old} \in R^p \xrightarrow[\text{matrix}, A]{} v_{new} = v_{old} \cdot A \in R^d, \ d < p$
- Dimensionality of a vector
- Direction of a vector
- Vector norm/length
